

GET PROFILE PICTURE TUTORIAL

Composed by: Charlie Tan

Local Route: http://localhost:5000/api/get_profile_picture (get_profile_picture)

Deployed Route: https://kindling-lp.herokuapp.com/api/get_profile_picture
(get_profile_picture)

EXPECTED INPUT FROM FRONTEND:

```
{  
  "email_str" : some_string,  
  "access_token_str" : some_string  
}
```

INPUT PROPERTIES EXPLAINED:

- 1) **email_str**: the email string corresponding to the user whose profile picture we are retrieving.
- 2) **access_token_str**: this is the access token originally provided by the backend proving that you are who you say you are. For more information on access tokens, please reference the login API tutorial.

EXPECTED OUTPUT FROM BACKEND:

-An image file with variable name and extension. For example, if the user originally uploaded an image called 'my_profile_pic.jpg', then the output for this API will be an image called 'my_profile_pic.jpg'.

-In the case that the user does NOT have a picture uploaded for themselves, then a default image will be returned instead.

-In any other case of failure, this API will always return the default image.
